

aani: end-to-end coverage run

Protocol: 98b5e09199a5eef0c46be452793e953f5a2af31e.

Stage	Count	Unit / status
papers_retrieved	33	unique sources with cached full text; complete
screened_in	13	unique sources selected by any inclusion route; complete
extraction_jobs	23	model jobs; complete
candidate_records	61	original model candidates; complete
grounding_passed	41	original model candidates; complete
semantically_retained	9	original model records retained by source review; complete
names_resolved	17	distinct accepted species identities; complete
genera_after_aggregation	11	directionally consistent genera; complete
genera_with_chemistry	9	eligible genera with at least one imported occurrence; complete
genera_with_classified_compounds	7	eligible genera with at least one active or inactive compound; complete
genera_available_for_primary_test	7	joined genera available before the feasibility gate; complete

The current behaviour metrics record 96 retained directional contexts: 6 model and 90 curator, including 87 Saverschek contexts. Those Saverschek contexts include the seven taxonomy-supplement contexts. The original model branch retains its separate nine-record source-review yield; curator replacement changes the final representation. Contexts share source evidence and are not independent biological observations.

Miconia verification: **conflict**; both accepted species identities and opposing directions were checked from records.

Primary status: **feasibility_failure**; estimable: **False**.

See `funnel.json` for cohort denominators, conflict counts, stage manifests, missingness and blocked reasons.

Chemistry used the verified LOTUS v4 export (Zenodo 6582121, CC BY 4.0), with version, download URL, retrieval time, checksum, licence and transform provenance in `data/processed/chemistry/run_manifest.json`.

Imported 27235 provenance rows / 3803 distinct occurrences / 2198 structures across the full audited genus scope.

ChEMBL retrieved 2198 structures: 7 active, 17 inactive and 2174 unknown; 0 retrieval failures. Unknowns are excluded from the classified denominator.

The primary join contains 6 accepted and 1 rejected genera. Inference blockers: `fewer_than_minimum_joined_genera`, `need_two_genera_per_direction`. All unavailable endpoints remain null; no substitute model or shortlist was produced.

Missing chemistry genera: Desmopsis, Hiraea. Genera with mapped chemistry and zero classified compounds: Randia, Trema. Unknown activity remains outside the classified denominator.

Original data and frozen protocol files remain intact. `results/offline_replay.json` records the completed offline replay checks; README and the pipeline guide describe the runnable chain.

Coverage funnel

Protocol commit 98b5e09199a5eef0c46be452793e953f5a2af31e; generated 2026-09-13T14:37:34.503659+00:00; status feasibility_failure; estimable False.
